

Tumark[®] Breast Biopsy Markers

Sand-blasted nitinol breast biopsy markers designed to provide excellent visibility during ultrasound imaging.

The Tumark[®] marker systems non-absorbent and self-expanding nitinol material enables long-term stability and visibility.

The markers are easily deployed single-handedly with a low-profile 18G delivery device for minimally invasive and precise marking of breast lesion.

Intelligent and differentiated three-dimensional shapes allow for ultrasound visibility from all transducer positions and provides tissue fixation.

Features:

Long-term Visibility

- Designed for excellent visibility during ultrasound imaging.
- Visible in all imaging modalities including mammography, ultrasound and MRI.

Innovative Marker Shapes

- Four distinctive shapes to provide a wide range of marker options and easy distinction between multiple biopsy sites.

Low-profile Delivery

- Ergonomic 18G handle grips with easy-to-use slider for convenient one-handed positioning of the marker.
- MRI compatible handle available.
